Cement production accounts for 8% of global CO₂ emissions, necessitating its deep decarbonization. This paper reviews: (i) electrolysis-based methods to produce cement precursors, ...

In this Review, we shed light on the available solutions that can be implemented within the next decade and beyond to reduce greenhouse gas emissions from cement and concrete ...

To address this gap, this study introduces a structured assessment model designed to evaluate and rate proposed CO₂ improvement measures based on their alignment with the global ...

It is important to note that even if a cement plant electrified all its heat and power and/or used bio-derived fuels, about half of the current carbon dioxide emissions would still be emitted due to the ...

Decarbonization of cement industry is a necessity because of the global net-zero emissions target of 2050. This review comprehensively examines current and emerging Carbon Capture, ...

This review provides a comparative assessment of how calcium-looping technology has been applied in fossil-based power plants and cement plants for CO₂ capture versus in solar ...

Published results from 400 studies of PV systems including crystalline silicon (c-Si) (mono-crystalline and multi-crystalline) and thin film (TF) (amorphous silicon [a-Si], cadmium telluride [CdTe], and ...

This paper provides a comprehensive analysis of decarbonising cement and concrete production, addressing strategies, technologies, policy considerations, case studies, economic ...

Photovoltaic (PV) systems are regarded as clean and sustainable sources of energy. Although the operation of

Environmental Comparison of 150-foot Photovoltaic Containers Used in Cement Plants

PV systems exhibits minimal pollution during their lifetime, the probable ...

An innovative and efficient solar power plant solution has been developed for cement factories. On an annual basis, solar PV systems in cement plants may save 22,941 tonnes of CO₂.
