-----

Despite the abundance of solar radiation, significant energy losses occur due to scattering, reflection, and thermal dissipation. Glass mitigates these losses by functioning as a ...

The transmission spectrum of glass explains how light interacts with glass, influencing its use in solar panels, lenses, architecture, and optical technologies.

Solar transmittance, also referred to as light transmittance or visible transmittance, is the measurement of visible light passing through a piece of glass. Solar transmittance can be altered by the addition of ...

At Berkeley Lab we maintain the International Glazing Database of glass properties storing transmittance and reflectance as a function of wavelength for more than 5,000 glass products.

They found that clear glass allows up to 90% of VIS light and up to 72% of UV to pass through, depending on its thickness. Tinted glass reduced transmittance to 62% and 40%, respectively.

Our solar tempered glass is highly transparent to visible light. It has a visible light transmittance of over 90%. This means that more than 90% of the visible light in sunlight can pass ...

Light to Solar Gain (LSG) is a ratio that results from a window's SHGC being divided by its VLT rating. The LSG ratio measures the glass's ability to transmit light and block heat in the form ...

U-factor is the rate at which a window, door, or skylight transmits non-solar heat flow. For windows, skylights, and glass doors, a U-factor may refer to just the glass or glazing alone. NFRC U-factor ...

In this blog, Swift Glass discusses the properties of light and the six different behaviors that light has on glass.

When solar radiation strikes a glass surface, part of it (about 8 percent for uncoated clear glass) is reflected back to outdoors, part of it (5 to 50 percent, depending on composition and thickness) is ...
